 Modification of a rodent antibody (Ab) or fragment by resurfacing in order to produce a humanised rodent Ab can be determined by calculating homology between murine and human Ab antibody surfaces. In order to test the resurfacing approach of the invention, three humanisation experiments were set up: (1) traditional loop grafting; (2) resurfacing approach using most similar chain; and (3) resurfacing approach using human sequences with most similar surface residues. The Ab used was the murine anti-N901 Ab (see AAR52061). Experiment 3 was carried out using the present sequence which represents the human PiO123 Ab light chain variable region with 74 percent homology with anti-N901 Ab. N901/PIO123 (AAR52067) was prepd. by resurfacing. Sequence numbering starts at possition 118 in the specification.

 The invention relates to a peptide or polypeptide comprising an Fv CC molecule, a construct or fragments or a construct of a fragment with CC enhanced binding characteristics which selectively and/or specifically CC binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single CC chain Fv (scFv) or a disulfide Fv (dsFv). The peptide, optionally in CC association with or attached, coupled, combined, linked or fused to a continuous control of the medicament has activity against a diseased cell, preferably a cancer CC cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, CC myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an CC composition for use in inhibiting the growth of a diseased or cancer CC cell. This sequence represents a human Fv molecule hypervariable region CC related peptide of the invention.

protein sequences (AAR66295-51) are novel human immunoglobulin heavy chain sequences encoded by novel isolated genes. The genes (AAQ78939-79002) were isolated and cloned from a series of cosmid constructs; Y202; Y103; Y21; Y6;Y24; 3-31; M84; M118 and M.31, by PCF amplification using primers AAQ78917-38. The genes are subdivided in families of Vh genes. The fragments cover a region of 800 kb. The fragments were isolated from high molecular weight DNA from human placenta. The DNA was partially digested with TagI restriction enzyment fragments were separated by gel elecrophoresis and 35-45 kb fract

 Human; mouse; variable heavy; VH; antigen; cancer; complementarity determining region; TANGO 268; glycoprotein VI; GPVI; TANGO 268; extracellular matrix; collagen; platelet release; proliferation; migration; embryogenesis; inflammation; thrombosis; degranulation; thrombocytopaenia; antibody; thrombotic disorder; cerebral vascular disease; stroke; ischaemia; venous thromboembolism; leg swelling; pain; ulceration; pulmonary embolism; coronary disease; cardiovascular disease; angina pectoris; myocardial infarction; coronary restenosis; atherosclerosis; immunological disorder; developmental disorder; embryonic disorder; liver disorder; cerebral vascular disease; venous thromboembolism disease.
 ribozymes and antibodies, are useful for preventing, treating and diagnosing disorders associated with aberrant expression or activity of GPVI. These disorders include bleeding disorders (e.g. thrombocytopaenia), blood vessel injury, thrombotic disorders (e.g. thrombotic occlusion of the coronary arteries), haemorrhagic disorders, coronary artery and cerebral artery diseases (e.g. stroke and ischaemia), cardiovascular diseases (e.g. atherosclerosis and myocardial infarction), immunological diseases (e.g. platelet disorder) and embryonic liver disorders. Preferably they are used to prevent acture
 nucleic acid molecule encoding a platelet membrane glycoprotein receptor glycoprotein VI (GPVI), also called TANGO 268. The GPVI polynucleotides and polypeptides and their modulators, e.g. antisense nucleic acids,
 New genes encoding human platelet-expressed collagen receptor, glycoprotein VI, and its modulators, useful for preventing, treating and disamosing hemorrhagic disorders, thrombotic diseases and
 and diagnosing hemorrhagic immunological disorders -

 The invention describes a purified human S-acyl fatty acid synthase CC thioesterase (SFST) like enzyme (I) (I) is useful for screening for agents which decrease or regulate the activity of an SFST-like enzyme and CC agents which decrease extracellular matrix degradation. The CC encodes (I) in a biological sample by formation of a hybridisation cC encodes (I) in a biological sample by formation of a hybridisation cC entibody can also be used to detect the polypeptide or polynucleotide in CC antibody can also be used to detect the polypeptide or polynucleotide in CC antibody can also be used to detect the polypeptide or polynucleotide in CC antibody can also be used to detect the polypeptide or polynucleotide in CC antibody can assign a SFST-like enzyme dysfunction related disease condition such as cardiovascular disease, hyperlipidaemia, obesity, CC anorexia, wasting disorders, appetite suppression, appetite condition such as cardiovascular disease, hyperlipidaemia, obesity, CC anorexia, cachexia, wasting disorders, appetite suppression, appetite cCC enhancement, bulimia or diabetes. The cardiovascular diseases treated by the above mentioned methods and reagents include congestive heart CC failure, myocardial infarction, ischaemic diseases of the heart, atrial and contricular arrhythmia, hypertensive vascular diseases, and cCC entipheral vascular diseases. (I) is useful in diagnostic assays for CC detecting diseases and abnormalities related to presence of mutations in CCC acid sequences which encode the enzyme. This is the amino CCC enzyme, described in the method of the invention.

 brainiac protein, as glycosyltransferase. Fringe and Brainiac proteins have been found to possess glycosyltransferase activity in transferring sugar residues onto certain proteins of biological transferring sugar residues onto detertain proteins of biological interest, so affecting the binding of effector molecules to these proteins. Particularly they are useful for transferring a N-acetylglucosamine moiety onto a fucose or a mannose substrate, whether free or attached to a lipid, carbohydrate or protein. They are useful for carbohydrate or protein. They are useful in treatment of a disease caused by epidermal growth factor (EGF) like module containing protein, such as T cell leukaemia, breast cancer, stroke, dementia, cerebral autosomal dominant arteriopathy with subcortical infarcts, leucoencephalogathy and Alagille syndrome. Fringe and Brainiac proteins are also useful for screening ligands capable of modulating the activity of the protein. The present sequence is fly protein

 The invention relates to isolated polynucleotides (ABZ72147-ABZ42522) of a Streptococcus pneumoniae genomic sequence, a fragment or degenerate variant of the polynucleotide or a nucleic acid sequence 95% identical to one of the polynucleotides. The S. pneumoniae polynucleotides and encoded polypeptides (ABP81299-ABP81674) are useful for treating or preventing S. pneumoniae infections or non-systemic diseases, e.g. otitis media, which are induced or exacerbated by S. pneumoniae. These are also useful for detecting S. pneumoniae in a biological sample or diagnosing S. pneumoniae infection in a subject. The polynucleotides have antibacterial activity and are useful in gene therapy.
 The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a sequence not defined in the specification, for amplifying a sequence not defined in the specification, for amplifying a

 The invention relates to a complex between two interacting proteins in CC adipocyte cells, given in the specification. The proteins are identified CC by selecting a bait protein from a known adipocyte marker and then CC performing a yeast 2-hybrid selection to isolate prey proteins encoded by CC (RTM) (selected interacting domains) proteins. Also included are a CC polynucleotide encoding a polypeptide in the adipocyte cells, a CC recombinant host cell expressing at least one of the interacting CC polyneptides of the complex, selecting a modulating compound in adipocyte cells, a SID (RTM)) polypeptide comprising any of the 738 maino acid CC cells, a SID (RTM) polynucleotide comprising any of the 738 maino acid CC a SID (RTM) polynucleotide comprising any of the 738 mucleotide sequences given in the specification (including its fragment or variant), a vector CC comprising the vector, a protein chip comprising the polypeptides, a recombinant host cell CC a record comprising all or part of the data, listed in the specification. CC The complex, polypucleotides and compounds are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polypucleotides are useful as probes or primers. The CC complex is particularly useful for identifying selected interacting CC interaction, thus exhibiting the therapeutic effect. The present CC sequence represents a SID (prey) protein of the invention.
